

14X065 Digital forensics

CC2 questions

1. Traces of image editing: histogram equalization
2. Tampering detection: pixel-based and format-based techniques
3. Tampering detection: camera-based, physics-based and geometry-based techniques
4. Printed documents forensics: general principles
5. Device attribution: basic concepts
6. Printed document authentication: active approach
7. Approaches for text printed source detection
8. Laser Printer attribution
9. GLCM approach for Laser printer attribution
10. Convolutional Texture Gradient Filter (CTGF) descriptor
11. Deep Learning for Laser printer source attribution
12. Approaches for Printed pictures source detection
13. Principles of DNN watermarking
14. GAN watermarking
15. Supervised watermarking
16. Retraining free fingerprinting
17. Methods of information hiding
18. Basics of cryptography
19. Basics of steganography
20. Requirements to modern steganography
21. Steganography in spatial domain
22. Steganography in transform domain
23. Steganography by cover selection
24. Steganography by cover synthesis
25. Steganography by cover modification
26. LSB steganography
27. Empirical approaches of steganography
28. Biometric forensics: classification
29. Types of presentation attacks
30. Defence from face presentation attacks
